

Benefits Of Laparoscopic Surgery

- Less pain— up to 65%
less painful
- Smaller incisions
(minimally invasive)
- Better visualization of
abdominal organs
- Faster recovery
- Shorter anesthetic time

AAHA certification is a badge of excellence and is maintained only by rigorous inspections.

Hours

Laparoscopy (Minimally Invasive Surgery)

The laparoscope allows the surgeon to visualize organs in the abdomen or chest through a small "key hole" size incision that allows a special camera to enter through the body wall.

The images are displayed on a monitor in the surgery suite and the surgeon can view individual organs without having to "open up" the body as is done with typical exploratory surgeries.

Ovariohysterectomy (spay) performed with the laparoscope has been proven to be 65% less painful than traditional methods.

Liver after laparoscopic biopsy

We can use the laparoscope to perform such procedures as liver biopsies, stomach-tacking to prevent bloating and twisting of the stomach, spays, and intestinal biopsies.

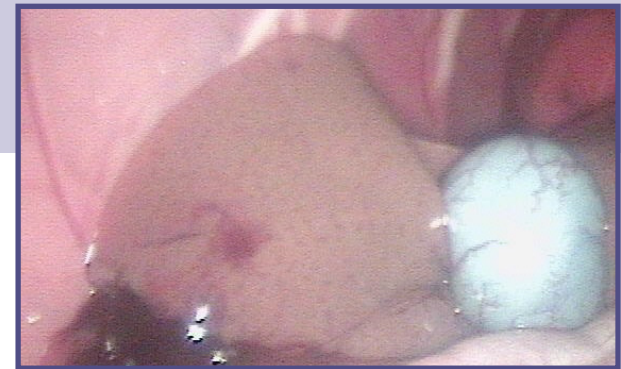

Pancreas

Ovary and uterine body after cautery used to seal blood vessels to the ovary.

The laparoscope can also be used to assist in traditional surgeries such as bladder surgery for stones, removal of a retained testicle in the abdomen. We can also document the appearance of certain organs or lesions with pictures taken by the laparoscopic camera.

Liver and gall bladder
